

Control Structure Manhole

Maintaining your control structure manhole requires a confined space certification and must be done by professionals.

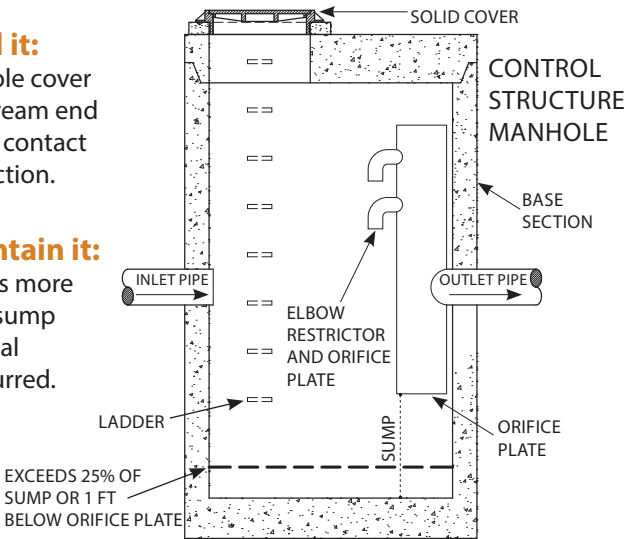

Control structures, also called flow restrictors, meter the release of stormwater from a facility at a specific rate. This helps to reduce erosion in local streams during rain events.

Where to find it:

Look for a manhole cover near the downstream end of your facility or contact your local jurisdiction.

When to maintain it:

When sediment is more than 25% of the sump depth or structural damage has occurred.

PRIVATE STORMWATER FACILITY MAINTENANCE

What you'll need:

A professional with a confined space certification will have the necessary tools and training. Find a contractor at: www.stormwaterpartners.com/contractors

A professional should:

1: Use a lid puller to remove the manhole lid.

2: Measure the sediment levels of the sump and pump if needed.

3: Inspect infrastructure and repair as needed.

4: Reinstall manhole lid and provide you with a report of maintenance performed.
